Congenital Adrenal Hyperplasia (CAH)

CAH refers to a group of genetic disorders that affect the adrenal glands. These glands sit on top of the kidneys and release hormones the body needs to function. CAH creates imbalances in these hormones, which cause a wide range of symptoms in infants, children, and adults.

NICHD research aims to find new ways to diagnose and treat the disorder, as well as to help health care providers and scientists better understand how it develops.

General Information

About Congenital Adrenal Hyperplasia

CAH refers to a group of genetic disorders that affect the adrenal glands. These glands release hormones the body needs to function.

[More >>](#)

What causes congenital adrenal hyperplasia?

CAH is caused by changes (mutations) in one of several genes. These changes lead to deficiencies in enzymes that the adrenal glands need to make proper amounts of some hormones.
