Enlarged adenoids

The adenoids are lymph tissues that sit in your upper airway between your nose and the back of your throat. They are similar to the tonsils.

Enlarged adenoids means this tissue is swollen.

Causes

Enlarged adenoids may be normal. They may grow bigger when the baby grows in the womb. The adenoids help the body prevent or fight infections by trapping bacteria and germs.

Infections can cause the adenoids to become swollen. The adenoids may stay enlarged even when you are not sick.

ADAM.

Symptoms

Children with enlarged adenoids often breathe through the mouth because the nose is blocked. Mouth breathing occurs mostly at night, but may be present during the day.

Mouth breathing may lead to the following symptoms:

- Bad breath
- Cracked lips

- Dry mouth
- Persistent runny nose or nasal congestion

Enlarged adenoids may also cause sleep problems. A child may:

- Be restless while sleeping
- Snore a lot
- Have episodes of not breathing during sleep (sleep apnea)

Children with enlarged adenoids may also have more frequent ear infections.

Exams and Tests

The adenoids cannot be seen by looking in the mouth directly. Your health care provider can see them by using a special mirror in the mouth or by inserting a flexible tube (called an endoscope) placed through the nose.

Tests may include:

- X-ray of the throat or neck
- Sleep study if sleep apnea is suspected

Treatment

Many people with enlarged adenoids have few or no symptoms and do not need treatment. Adenoids shrink as a child grows older.

Your provider may prescribe antibiotics or nasal steroid sprays if an infection develops.

Surgery to remove the adenoids (adenoidectomy) may be done if the symptoms are severe or persistent.

When to Contact a Medical Professional

Contact your provider if your child has trouble breathing through the nose or other symptoms of enlarged adenoids.

Alternative Names

Adenoids - enlarged
